Chemical-free microwave seed treatment

Parostok treats seed before sowing with a controlled 2.45 GHz microwave field. Dry process, no chemicals, no residues on the seed.

New design (rendering). The specifications refer to the current production model.

Laboratory germination test of the corn seed lots, April 2026.

How it works

- Seed flows continuously through a controlled microwave field.
- The dose is set by exposure time at fixed power; each crop and variety has its own mode.
- Treatment can be offered as a service or with the machine installed on site.

Key specifications (current model)

Power supply	**110 / 220 V**
Power consumption	**3.0–6.0 kW**
Throughput	**0.4–2.0 t/h**
Weight	**210 kg**
Dimensions	**70 × 90 × 206 cm**
Loading	**from the top**
Microwave frequency	**2.45 GHz (ISM band)**

Evidence to date

- **Independent laboratory, April 2026** (Plant Health Institute, Ukravit Science Park; commissioned by KARE; DSTU 4138-2002): 36 corn seed samples from 6 lots, 5 modes — uniform root development, no signs of suppression.
- **Weaker seed gains most:** in the same test the lowest lot (86 % germination) gained 6.2 points, while lots at 90–92 % changed by −1.6 to +1.6 points.
- **Field, Poland 2024** (RSUW Głuchów, KWS Nataelo): 11.97 vs 10.34 t/ha (+15.7 %). Single plots without replication — indicative only.
- **Research since 2000** with Ukrainian research institutes: 24 crops in the 2000–2001 programme, replicated field trials on winter wheat.

For whom

Seed producers and processors, cooperatives and large farms — especially for seed lots below their germination standard.
